SUBSTITUTED CARBOXANILIDOTHIAZOLES
AND THEIR USE AS FUNGICIDES

Field of the Invention

5 The present invention relates to certain substituted 5-carboxanilidothiazoles and their use as fungicides.

Background of the Invention

10 Various substituted carboxanilidothiazoles are known in the art as fungicides. A known fungicide, 2-amino-4-methyl-5-(carboxyanilido)thiazole, is sold under the trademark Seedvax. However, there still is a need in the art for fungicides which have the advantages of being safe on crops and efficacious at low application rates for cost savings and lower
15 pesticide load on the environment.

Summary of the Invention

20 The present invention relates to certain substituted 5-carboxanilidothiazoles and their use in the control of plant fungus diseases such as, for example Basidiomycetes. The carboxanilidothiazoles of the present invention are substituted on the thiazole ring as follows (the sulfur atom being the 1-position): in the 2-position on the thiazole ring - a halo
25 substituent preferably chloro, bromo or iodo and most preferably a chloro substituent; (ii) in the 4-position of the thiazole ring - a dihalomethyl or trihalomethyl, preferably trihalomethyl, most preferably trifluoromethyl, and (iii) in the
30 5-position of the thiazole ring - a carboxanilido substituent uniquely having at least three electron withdrawing substituents on the phenyl ring. The electron withdrawing substituents are selected from

-2-

halo, (preferably chloro, iodo or bromo), C₁₋₂ haloalkyl (preferably perhaloalkyl, preferably trifluoromethyl), C₁₋₂ haloalkoxy (preferably halomethoxy, preferably trifluoromethoxy), C₁₋₂ alkoxy, cyano and nitro. Preferred electron withdrawing groups are chloro, bromo, iodo, C₁₋₂ perhaloalkyl and halomethoxy. When there are only three electron withdrawing substituents on the phenyl ring, the substituents are located in the ortho and para positions. Preferably the para substituent, if any, also has lipophilic character.

The open positions on the phenyl ring of the carboxanilido group may also be substituted by a variety of other substituents other than hydrido which do not unacceptably interfere with the fungicidal activity of the molecule. Such substituents are preferably in the meta position. Suitable substituents include lower alkyl, lower alkylthio, lower alkylcarbonyl, lower alkoxy carbonyl and the like. Other types of suitable substituents will be known to those skilled in the art.

The degree of substitution on the phenyl ring of the carboxanilido group will vary from 3 to 5 but unstable molecules such as those with trinitro substitution or tetra or penta iodo substitution are outside the scope of this invention. The compounds of the present invention have good fungicidal activity at low application rates such as, for example on Basidiomycetes and are generally safe to the host plant. A more thorough disclosure of the present invention is presented in detailed description which follows.

-3-

Detailed Description

The present invention relates to certain substituted 5-carboxanilidothiazoles, compositions thereof and their use in the control of plant fungus disease such as, for example Basidiomycetes such as Rhizoctonia, Sclerotium and Corticium and other fungi such as Botrytis, Colletotrichum, Fusarium, Gaeumannomyces, and Sclerotium.

A preferred embodiment of the unique class of 5-carboxanilidothiazoles of the present invention are compounds represented by the Formula I and agronomically acceptable salts thereof:

Formula I

wherein A is dihalomethyl or trihalomethyl; D is halo; X is halo, C₁₋₂ haloalkyl, C₁₋₂ alkoxy, C₁₋₂ haloalkoxy, cyano or nitro; Y is chloro, bromo, iodo, C₁₋₂ perhaloalkyl, dihalomethoxy or trihalomethoxy; each Z is independently halo, C₁₋₂ haloalkyl, or C₁₋₂ haloalkoxy and n is an integer from 1 to 3 provided that when n is 1, Z is in the 4-position. Preferably A is trihalomethyl, most preferably trifluoromethyl. Preferably D is chloro. Preferably X and Z as C₁₋₂ haloalkyl or C₁₋₂ haloalkoxy have at least two halo substituents and more preferably 3 or more halo substituents. Preferably, X, Y and Z are each

-4-

independently chloro, bromo, iodo, C₁₋₂ perhaloalkyl (preferably trifluoromethyl) or trihalomethoxy (preferably trifluoromethoxy).

The term "carboxanilido" means C₆H₅NHCO-.

5 The term "halo" means fluoro, chloro, bromo or iodo.

The term "lower alkyl" means C₁₋₅ alkyl.

10 Open positions on the phenyl ring of Formula I which do not have a Z substituent may be substituted by other substituents which either enhance the activity of the molecule or do not unacceptably hinder the activity. Molecules having such substituents are contemplated as equivalents of the compounds claimed herein. Such substituents include the electronegative
15 substituents described herein or substituents such as lower alkylthio, lower alkyl, lower alkoxy, lower alkylcarbonyl or lower alkoxycarbonyl. Those skilled in the art will be able to select other types of suitable substituents.

20 Another preferred embodiment of the unique class of 5-carboxanilidothiazoles of the present invention are compounds represented by the Formula II and agronomically acceptable salts thereof:

Formula II

-5-

wherein X is halo, trihalomethyl, trihalomethoxy,
nitro or cyano; Y and Z are independently chloro,
bromo, iodo, trihalomethyl (preferably trifluoro-
methyl) dihalomethoxy (preferably difluoromethoxy)
5 or trihalomethoxy (preferably trifluoromethoxy).

Open positions on the phenyl ring of Formula
II may be substituted by other substituents which
either enhance the activity of the molecule or do not
unacceptably hinder the activity such as electro-
10 negative substituents as described herein or
substituent such as lower alkyl, lower alkoxy, lower
alkylthio, lower alkylcarbonyl, or lower alkoxy-
carbonyl. Compounds having such substituents are
contemplated as equivalents of the compounds claimed
15 herein.

Another preferred embodiment of the unique
class of 5-carboxanilidothiazoles of the present
invention are compounds represented by the Formula III
and agronomically acceptable salts thereof:

20

Formula III

-6-

wherein each E is independently chloro, bromo, iodo, trifluoromethyl or trifluoromethoxy.

5 The open position on the phenyl ring of Formula III may be substituted by other substituents which either enhance the activity of the molecule or do not unacceptably hinder the activity such as electronegative substituents as described herein or a substituents such as lower alkyl, lower alkoxy, lower alkylthio, lower alkylcarbonyl or lower alkoxy carbonyl.
10 Compounds having such substituents are contemplated as equivalents of the compounds claimed herein.

Another preferred embodiment of the unique class of 5-carboxanilidothiazoles of the present invention are compounds represented by the Formula IV
15 and agronomically acceptable salts thereof:

Formula IV

wherein each W is independently chloro, bromo, iodo, trifluoromethyl or trifluoromethoxy. W is preferably chloro.

-7-

Agronomically acceptable salts of the present invention include alkali, alkaline earth, acid addition, base addition and alkylation salts.

Other suitable electron withdrawing ring substituents for compounds of the present invention include pentahalosulfur, preferably pentafluorosulfur, halomethylthio, haloethylthio, (C₁₋₂ alkyl or C₁₋₂ haloalkyl) sulfinyl or (C₁₋₂ alkyl or C₁₋₂ haloalkyl) sulfonyl. Compounds having such electron withdrawing substituents on the phenyl ring in accordance with the present invention are contemplated as equivalents of the compounds claimed herein.

The procedures described below depict suitable methods whereby the compounds of this invention may be prepared by known chemical procedures from compounds which are known in the art and/or are readily available commercially. These procedures described below are merely illustrative and those skilled in the art will know a variety of other procedures suitable for use in making the compounds of the present invention.

Compounds of the present invention can be prepared by reacting an appropriately substituted thiazole having a 5-carbonylchloride substituent with an appropriately substituted aniline in suitable solvent(s) at an elevated temperature. Suitable solvents include xylene, THF, toluene, chlorobenzene, collidine, and 2,6-di-t-butyl-4-methyl pyridine. In some cases, acid acceptors such as tertiary amines and pyridines may be used to accelerate the rate of reaction. The acid acceptor may also function as the solvent.

-8-

Appropriately substituted anilines are commercially available or may be prepared by standard chemical procedures. For example, halo substituted anilines can be prepared by halogenation of
5 appropriately substituted anilines using standard techniques.

The thiazoles are conveniently prepared by the following sequential reactions: (i) reacting ethyl 4,4,4 trifluoro-2-chloroacetoacetate with
10 thiourea in a suitable solvent, preferably DMF to form ethyl 2-amino-4-trifluoromethyl-5-thiazole-carboxylate; (ii) reacting the product of (i) with HCl and sodium nitrite (or with amyl nitrite and cuprous chloride) to form 2-chloro-4-trifluoromethyl-
15 5-thiazolecarboxylate and (iii) converting the product of (ii) into the corresponding acid chloride with sequential hydrolysis with base and reaction with thionyl chloride.

The following Examples 1-5 are detailed
20 descriptions of methods of preparation of certain compounds of the present invention. These detailed preparations fall within the scope of, and serve to exemplify, the more generally described methods of preparation set forth above. These Examples are
25 presented for illustrative purposes only and are not intended as a restriction on the scope of the invention.

Example 1

-9-

2-chloro-4-trifluoromethyl-5-(pentachlorocarboxanilido) thiazole.

To a solution of 5.31 g (0.02 mol) of pentachloroaniline in 50 ml of xylene was added 5.0 g (0.02 mol) of 2-chloro-4-trifluoromethyl-5-chloro-carbonyl thiazole and the resulting solution heated to reflux for 4 days. The mixture was cooled and petroleum ether added to precipitate a white solid. The solid was purified on TLC in 30:70 ethylacetate: hexane to give 5.14 g of a solid m.p. 237-238°C.

Example 2

2-chloro-4-trifluoromethyl-5-(2',6'-dichloro-4-iodo-carboxanilido) thiazole.

To a solution of 2.9 g (0.01 mol) of 2',6'-dichloro-4-iodoaniline was added 2.5 g (0.01 mol) of 2-chloro-4-trifluoromethyl-5-chlorocarbonyl thiazole and the mixture heated to reflux for 12 hours. The mixture was cooled to room temperature and cyclohexane was added to precipitate 3.1 g of a white crystalline product m.p. 200-202°C (yield 62%).

Example 3

2-chloro-4-trifluoromethyl-5-(2',6'-dibromo-4-trifluoromethyl carboxanilido) thiazole.

To the solution of 3.2 g (0.01 mol) of 2',6'-bromo-4-trifluoromethylaniline was added 2.5 g (0.01 mol) of 2-chloro-4-trifluoromethyl-5-chloro-carbonyl thiazole and 70 ml of xylene and the mixture heated to reflux for 18 hours. The mixture was cooled to room temperature, evaporated to low volume and cyclohexane was added to precipitate 2.8 g of a white crystalline product m.p. 178-180°C (yield 53%).

-11-

Example 4

2-chloro-4-trifluoromethyl-5-(2',6'-dibromo-3',5',
di[trifluoromethyl]carboxanilido) thiazole.

2.33 g (0.005 mol) of 2',6'-dibromo-3'5'-di-
5 [trifluoromethyl]aniline was mixed with 1.5 g (0.006
mol) of 2-chloro-4-trifluoromethyl-5-chlorocarbonyl
thiazole and 1.44 g (0.007 mol) of 2,6di-tertbutyl-2-
methyl pyridine and heated at 120°C for 3 hours. The
mixture was cooled to room temperature, dissolved in
10 ethyl acetate and water and transferred to a separation
funnel. Sodium bicarbonate was added and the organic
layer separated, dried and evaporated until crystals
formed. Heptane was added and the crystals collected
to give 1.81 g of a white crystalline solid m.p.
15 226-227.

-12-

Example 5

2-chloro-4-trifluoromethyl-5-(2',6',dibromo-4-trifluoromethoxy carboxanilido) thiazole.

To the solution of 3.35g (0.01 mol) of
 5 2',6'-dibromo-4-trifluoromethoxyaniline was added 2.5g
 (0.01 mol) of 2-chloro-4-trifluoromethyl-5-chloro-
 carbonyl thiazole and 70 ml of toluene and the mixture
 heated to reflux for 18 hours. The mixture was
 cooled to room temperature, evaporated to low volume
 10 and cyclohexane was added to precipitate 4.2g of a
 white crystalline product m.p. 138-140°C (yield 76%).

Primary Test For
Activity On Rice Sheath Blight

5 The *Rhizoctonia solani* is cultured on
rice grain inoculum at room temperature in darkness in
the laboratory. Inoculum is prepared by mixing one
part rice grain, one part chopped rice grain and one
part water. The mixture is autoclaved twice before
use. Sclerotia of the fungus are added to each flask
and the inoculum is ready for use when mycelia of
10 *Rhizoctonia solani* have ramified throughout the medium
and new sclerotia have formed (generally in about four
to eight weeks).

15 Rice plant seeds, 16-18, are planted in the
center of a 3 inch square pot (7.62 cm²) and covered
with steam sterilized soil (silt loam, rediearth and
osmocote). The pots are placed in the greenhouse at
25-30°C, with 14 hours of lighting. In about 11-15
days the plants are in the second to third leaf stage
and ready for testing.

20 The test compounds are diluted to 1% by weight
solution in acetone. Prior to application, the test
solutions are prepared in concentrations of 0.5; 0.1
and 0.02mg/ml having a formulation of 40% acetone,
0.4% Tween-20 and 59.6% water.

25 Plants are sprayed at the second to third
leaf stage. Two ml of the formulation is drenched
onto the soil of the pot, approximately 1.5 ml/pot is
then foliarly applied using a "Devilbiss 152" atomizer.
The atomizer is rinsed with acetone between
30 treatments.

-23-

The rice plants are allowed to air dry at room temperature before being returned to the greenhouse. The pots are placed into a specially fabricated plastic flood tray. There are no drain
5 holes in the trays, so water is retained in the system.

All pots are kept in the flood trays, which are filled with water to the soil line before inoculation. Two days later, approximately 2 grams of the
10 inoculum is applied to each pot at the base of the clump of rice. The trays are then placed into a dark growth room at 100% relative humidity and 25 C. After at least 24 hours of darkness, the lights are turned
15 onto a 12 hour light cycle. The plants are left undisturbed for 4 to 7 days and then rated for disease control. Disease control is assessed on the presence and severity of Sheath Blight lesions as compared to control pots. One rating for each treatment (four pots) is taken.

-24-

The following rating scale is used:

- 0 = No activity
 1 = Low activity
 2 = Moderate activity
 3 = High activity

Table II summarizes the results of tests conducted to determine the fungicidal activity of the compounds of this invention.

Advanced Testing For
Activity On Rice Sheath Blight

The host seeds are planted and *R. solani* is cultured as previously described. The plants are
5 inoculated at the three leaf stage. To inoculate the plants, the inoculum is removed from the flasks, broken into small bits or individual grains and a small amount (1 cm³) is added to the base of each clump of rice plants. After inoculation, the plants
10 are moved to a dark growth room set for fog and 25C. Lights are returned to a 12 hour day/night cycle after 24 hours of darkness.

The test solutions are prepared in the same manner as in the primary test.

15 For foliar application, the plants are sprayed when the third leaf is fully expanded but the fourth leaf has not emerged. The surface of all pots is covered with a layer of vermiculite before chemical application which is removed immediately after appli-
20 cation for all foliar spray tests. Compounds are applied using a DeVilbiss air-brush sprayer. Two ml/pot volume is applied which is enough to cover all surfaces of the plants to wetness but not enough to cause the material to drip from the leaves. Plants
25 are moved to the drying room after spraying (very low light conditions) and after 3-4 hours are moved to the greenhouse bench. If plants are planted on day "0", then typically the chemical is applied on day 14, and pathogen inoculation occurs on day 16. Evaluation of
30 disease will be made on day 26 to 30. Disease is evaluated by estimating the amount of stem tissue that

-27-

is covered by symptoms; water soaking, chlorosis and necrosis and converted to a percent control as compared to the formulation treated check.

5 The protocol for the soil drench protective
test is identical to that of the foliar protectant
test except for the method of applying the chemical.
Chemical test solutions are prepared and are applied
to the soil surface with a pipette (1ml/pot). Plants
are moved to the greenhouse within 30 minutes of
10 treatment. Plants are watered immediately with
sufficient water to fill the top of the pot and kept
for 2 days with the soil saturated. Inoculation,
incubation and evaluation are made on the same
schedule and in the same manner as the foliar
15 protectant test.

Table III summarizes the results of tests conducted to determine the fungicidal activity of the compounds of this invention.

Test For Activity On Brown Patch

Creeping bentgrass was grown in greenhouse in five inch diameter plastic pots for a period of 6 weeks. One day prior to test initiation the turf was mowed to approximately one inch in height. The test compounds were formulated as flowables. The formulated materials were dissolved in appropriate amount of water to give final test solutions having concentrations of 1, 0.2 and 0.04 mg/ml of active ingredient.

Four pots or replicates were used for each treatment with each test pot receiving 5 ml of test solution. Treatments were applied to turf foliage using DeVilbiss type sprayer. Pots were placed in growth chamber at 28C, 95% humidity and 12 hours lighting at 400 uE/meter square.

The test pathogen *Rhizoctonia solani* was cultured on sterilized sorghum seed three weeks prior to test initiation. Two days after chemical treatment pots were inoculated by placing ten *Rhizoctonia* infested sorghum seed in each pot. Inoculated pots were returned to growth chamber and daylength was reduced to 8 hours to encourage *Rhizoctonia* infestation and brown patch symptoms.

Ten days after inoculation, test pots were removed from growth chamber and evaluated for disease and phytotoxicity. The percent *Rhizoctonia* brown patch infection was evaluated in each pot.

The test results are shown in Table IV.

Test For Activity on Peanut White Mold

Peanuts are grown in the field on a 36 inch row spacing using normal agronomic practices. Individual plots consisted of two adjacent rows cut into 50 foot length for a total of 100 row feet per plot. The test compounds were formulated as flowables and applied at rates which varied the amount of active ingredient per acre. Rates were calculated on a broadcast basis while the test solutions were applied in a 12 inch band centered over the plant row. Spray volume was 25 gallons/A (238 l/ha) and the test solutions were applied through even flat fan nozzle tips. Four replicate plots are used for each treatment. The test plots received three applications, one at pegging, one 4 weeks after pegging and one 8 weeks after pegging. The test pathogen Sclerotium rolfsii was cultured on sterilized oat seed for 21 days. The fungus/oat seed mixture was removed from culture flasks, air dried for 3 days, and then stored at room temperature until use (within 30 days). At approximately 70 days after planting, 250 ml of the fungus/oat seed inoculum was applied to each plot by dispersing the inoculum mixture down the center of both plot rows. The artificial inoculum was used as a supplement to the natural pathogen population present at the test site. Test treatments were evaluated for disease and phytotoxicity by counting total disease loci in the treated plot rows. A disease locus was one dead plant or up to 12 linear inches of row with dead plants. Evaluations were made at 130 days after planting. The test results are shown in Table V.

-35-

As can be seen from the data above, the compounds of the present invention have good fungicidal activity at low application rates for resulting cost savings and lower pesticide load on the environment. The compounds of the present invention
5 generally exhibit good fungicide control generally with no plant injury or with transient plant injury.

The fungicidal compositions of this invention, including concentrates which require
10 dilution prior to application, contain at least one active ingredient and an adjuvant in liquid or solid form. The compositions are prepared by admixing the active ingredient with an adjuvant including
15 diluents, extenders, carriers, and conditioning agents to provide compositions in the form of finely-divided particulate solids, granules, pellets, solutions, dispersions or emulsions. Thus, it is believed that
20 the active ingredient could be used with an adjuvant such as a finely-divided solid, a liquid of organic origin, water, a wetting agent, a dispersing agent, an emulsifying agent or any suitable combination of these.

Suitable wetting agents are believed to include alkyl benzene and alkyl naphthalene sulfon-
25 ates, sulfated fatty alcohols, amines or acid amides, long chain acid esters of sodium isothionate, esters of sodium sulfosuccinate, sulfated or sulfonated fatty acid esters, petroleum sulfonates, sulfonated vegetable oils, ditertiary acetylenic glycols,
30 polyoxyethylene derivatives of alkylphenols (particularly isooctylphenol and nonylphenol) and polyoxyethylene derivatives of the mono-higher fatty acid esters of hexitol anhydrides (e.g., sorbitan).

-36-

Suitable dispersants are methyl, cellulose, polyvinyl alcohol, sodium lignin sulfonates, polymeric alkyl naphthalene sulfonates, sodium naphthalene sulfonate, polymethylene bisnaphthalene sulfonate and polyethyleneoxide-polypropyleneoxide copolymers.

Wettable powders are water-dispersible compositions containing one or more active ingredients, an inert solid extender and one or more wetting and dispersing agents. The inert solid extenders are usually of mineral origin such as the natural clays, diatomaceous earth and synthetic minerals derived from silica and the like. Examples of such extenders include kaolinites, attapulgite clay and synthetic magnesium silicate. The wettable powders compositions of this invention usually contain from above 0.5 to 60 parts (preferably from 5-20 parts) of active ingredient, from about 0.25 to 25 parts (preferably 1-15 parts) of wetting agent, from about 0.25 to 25 parts (preferably 1.0-15 parts) of dispersant and from 5 to about 95 parts (preferably 5-50 parts) of inert solid extender, all parts being by weight of the total composition. Where required, from about 0.1 to 2.0 parts of the solid inert extender can be replaced by a corrosion inhibitor or anti-foaming agent or both.

Other formulations include dust concentrates comprising from 0.1 to 60% by weight of the active ingredient on a suitable extender; these dusts may be diluted for application at concentrations within the range of from about 0.1-10% by weight.

Aqueous suspensions or emulsions may be prepared by stirring a nonaqueous solution of a water-insoluble active ingredient and an emulsification agent

-37-

with water until uniform and then homogenizing to give stable emulsion of very finely-divided particles.

The resulting concentrated aqueous suspension is characterized by its extremely small particle size, so that when diluted and sprayed, coverage is very uniform. Suitable concentrations of these formulations contain from about 0.1-60% preferably 5-50% by weight of active ingredient, the upper limit being determined by the solubility limit of active ingredient in the solvent.

Concentrates are usually solutions of active ingredient in water-immiscible or partially water-immiscible solvents together with a surface active agent. Suitable solvents for the active ingredient of this invention include dimethylformamide, dimethylsulfoxide, N-methylpyrrolidone, hydrocarbons, and water-immiscible ethers, esters, or ketones. However, other high strength liquid concentrates may be formulated by dissolving the active ingredient in a solvent then diluting, e.g., with kerosene, to spray concentration.

The concentrate compositions herein generally contain from about 0.1 to 95 parts (preferably 5-60 parts) active ingredient, about 0.25 to 50 parts (preferably 1-25 parts) surface active agent and where required about 4 to 94 parts solvent, all parts being by weight based on the total weight of emulsifiable oil.

Granules are physically stable particulate compositions comprising active ingredient adhering to or distributed through a basic matrix of an inert, finely-divided particulate extender. In order to aid leaching of the active ingredient from the particulate extender, a surface active agent such as those listed hereinbefore can be present in the composition.

-38-

Natural clays, pyrophyllites, illite, and vermiculite are examples of operable classes of particulate mineral extenders. The preferred extenders are the porous, absorptive, preformed particles such as preformed and screened particulate attapulgite or heat expanded, particulate vermiculite and the finely-divided clays such as kaolin clays, hydrated attapulgite or bentonitic clays. These extenders are sprayed or blended with the active ingredient to form the herbicidal granules.

The granular compositions of this invention may contain from about 0.1 to about 30 parts by weight of active ingredient per 100 parts by weight of clay and 0 to about 5 parts by weight of surface active agent per 100 parts by weight of particulate clay.

Suitable types of formulations are emulsifiable concentrates, flowables, wettable powders, dusts and granules. A suitable flowable formulaion (3lb/gal) (0.35 kg/l) is as follows:

	<u>INGREDIENTS</u>	<u>% BY WGT</u>
	Compound of Example 1	31.14
	Xanthan gum	1.25
	block copolymers of	
	propylene oxide and	
25	ethylene oxide	2.50
	magnesium aluminum	
	silicate	1.00
	lignosulfonate dispersant	2.00
	defoamer	0.25
30	water	<u>61.86</u>
		100.00

-39-

The compounds of the present invention generally appear to show the greatest activity when applied as a foliar spray.

The compositions of this invention can also contain other additaments, for example, other fungicides, fertilizers, insecticides, herbicides, other pesticides, safeners and the like used as adjuvants or in combination with any of the above described adjuvants. Other fungicides can be useful in combination with the active ingredients of this invention including fungicides having activity on Rhizoctonia. Fungicides which may be useful in combination with compounds of the present invention include:

15	Tricyclazole	propiconazole
	Pyroquilon	prochloraz
	Chlorothalonil	maneb/mancozeb
	Triadimenol	Iprodione
	Fenpropimorph	Thiabendazole
20	Carbendazim	Probuazazole
	Triadimefon	Edifenphos
	Flusilazol	IBP
	Metalaxyl	Isoprothiolane

Other suitable fungicides will be known to those skilled in the art.

When operating in accordance with the present invention, effective amounts of the compounds of this invention are applied to the foliage or vegetative propagules or may be incorporated into the soil or water around the foliage in any convenient fashion. The application of liquid and particulate solid compositions to the soil can be carried out by conventional

-40-

methods, e.g., power dusters, boom and hand sprayers and spray dusters. The compositions can also be applied from airplanes as a dust or a spray because of their effectiveness at low dosages.

5 The exact amount of active ingredient to be employed is dependent upon various factors, including the plant species and stage of development of plants and disease, the type and condition of soil, the amount of rainfall and the specific compounds employed.
10 In selective foliar application a dosage of from about 30 to about 500 g/ha preferably from about 60 to about 250 g/ha, is usually employed. In soil applications a dosage of from about 100 to about 1000 g/ha, preferably from about 250 to about 500 g/ha is usually
15 employed. Lower or higher rates may be required in some instances. One skilled in the art can readily determine from this specification, including the above examples, the optimum rate to be applied in any particular case.

20 Although the invention is described with respect to specific modifications, the details thereof are not to be construed as limitations, for it will be apparent that various embodiments, changes and modifications may be resorted to without departing from the
25 spirit and scope thereof and it is understood that such equivalent embodiments are intended to be included within the scope of this invention.

-41-

WE CLAIM:

1. A compound selected from those represented by the Formula I and agronomically acceptable salts thereof:

5

Formula I

wherein A is dihalomethyl or trihalomethyl; D is halo; X is halo, C₁₋₂ haloalkyl, C₁₋₂ alkoxy, C₁₋₂ haloalkoxy, cyano or nitro; Y is chloro, bromo, iodo, C₁₋₂ perhaloalkyl, dihalomethoxy or trihalomethoxy; each Z is independently halo, C₁₋₂ haloalkyl, or C₁₋₂ haloalkoxy; and n is an integer from 1 to 3; provided that when n is 1, Z is in the 4-position.

2. The compound of claim 1 wherein D is chloro.

3. The compound of claim 2 wherein A is trihalomethyl.

4. The compound of claim 3 wherein A is trifluoromethyl.

5. The compound of claim 4 wherein X, Y and Z are each independently chloro, bromo, iodo, C₁₋₂ perhaloalkyl or trihalomethoxy.

-42-

6. The compound of claim 5 wherein X, Y and Z are each independently chloro, bromo, iodo, trifluoromethyl or trifluoromethoxy.

7. A compound selected from those represented by the Formula II and agronomically acceptable salts thereof:

Formula II

wherein X is halo, trihalomethyl, trihalomethoxy, nitro or cyano; Y and Z are independently chloro, bromo, iodo, trihalomethyl or trihalomethoxy.

8. The compound of claim 7 wherein Y and Z are independently chloro, bromo, iodo, trifluoromethyl or trifluoromethoxy.

9. A compound selected from those represented by the Formula III and agronomically acceptable salts thereof:

-43-

Formula III

wherein each E is independently chloro, bromo, iodo, trifluoromethyl or trifluoromethoxy.

10. A compound selected from those
5 represented by the Formula IV and agronomically acceptable salts thereof:

Formula IV

wherein each W is independently chloro, bromo, iodo, trifluoromethyl or trifluoromethoxy.

- 10 11. A compound of Claim 10 wherein W is chloro.

-44-

12. A fungicidal composition comprising a fungicidally effective amount of a compound selected from those represented by the Formula I and agro-nomically acceptable salts thereof:

5

Formula I

wherein A is dihalomethyl or trihalomethyl; D is halo; X is halo, C₁₋₂ haloalkyl, C₁₋₂ alkoxy, C₁₋₂ haloalkoxy, cyano or nitro; Y is chloro, bromo, iodo, C₁₋₂ perhaloalkyl, dihalomethoxy or trihalomethoxy; each Z is independently halo, C₁₋₂ haloalkyl, or C₁₋₂ haloalkoxy; and n is an integer from 1 to 3; provided that when n is 1, Z is in the 4-position.

13. The composition of claim 12 wherein D is chloro.

14. The composition of claim 13 wherein A is trihalomethyl.

15. The composition of claim 14 wherein A is trifluoromethyl.

16. The composition of claim 15 wherein X, Y and Z are each independently chloro, bromo, iodo, C₁₋₂ perhaloalkyl or trihalomethoxy.

-45-

17. The composition of claim 16 wherein X, Y and Z are each independently chloro, bromo, iodo, trifluoromethyl or trifluoromethoxy.

18. A fungicidal composition comprising a
5 fungidically effective amount of a compound selected from those represented by the Formula II and agro-nomically acceptable salts thereof:

Formula II

10 wherein X is halo, trihalomethyl, trihalomethoxy, nitro or cyano; Y and Z are independently chloro, bromo, iodo, trihalomethyl or trihalomethoxy.

19. The composition of claim 18 wherein Y and Z are independently chloro, bromo, iodo, trifluoromethyl or trifluoromethoxy.

15 20. A fungicidal composition comprising a fungidically effective amount of a compound selected from those represented by the Formula III and agro-nomically acceptable salts thereof:

-46-

Formula III

wherein each E is independently chloro, bromo, iodo, trifluoromethyl or trifluoromethoxy.

21. A fungicidal composition comprising a
5 fungidically effective amount of a compound selected
from those represented by the Formula IV and agro-
nominally acceptable salts thereof:

Formula IV

- wherein each W is independently chloro, bromo, iodo,
10 trifluoromethyl or trifluoromethoxy.

-47-

22. The composition of Claim 21 wherein W is chloro.

23. A method of controlling the growth of fungus disease on a plant comprising applying to the plant locus an effective amount of a compound selected from those represented by the Formula I and agro-nomically acceptable salts thereof:

Formula I

wherein A is dihalomethyl or trihalomethyl; D is
10 halo; X is halo, C₁₋₂ haloalkyl, C₁₋₂ alkoxy, C₁₋₂
haloalkoxy, cyano or nitro; Y is chloro, bromo, iodo,
C₁₋₂ perhaloalkyl, dihalomethoxy or trihalomethoxy;
each Z is independently halo, C₁₋₂ haloalkyl, or
C₁₋₂ haloalkoxy; and n is an integer from 1 to 3;
15 provided that when n is 1, Z is in the 4-position.

24. The method of claim 23 wherein D is chloro.

25. The method of claim 24 wherein A is trihalomethyl.

-48-

26. The method of claim 25 wherein A is trifluoromethyl.

27. The method of claim 26 wherein X, Y and Z are each independently chloro, bromo, iodo,
5 C₁₋₂ perhaloalkyl or trihalomethoxy.

28. The method of claim 27 wherein X, Y and Z are each independently chloro, bromo, iodo, trifluoromethyl or trifluoromethoxy.

29. A method of controlling the growth of
10 fungus disease on a plant comprising applying to the plant locus an effective amount of a compound selected from those represented by the Formula II and agro-nomically acceptable salts thereof:

Formula II

15 wherein X is halo, trihalomethyl, trihalomethoxy, nitro or cyano; Y and Z are independently chloro, bromo, iodo, trihalomethyl or trihalomethoxy.

30. The method of claim 29 wherein Y and
20 Z are independently chloro, bromo, iodo, trifluoromethyl or trifluoromethoxy.

-49-

31. A method of controlling the growth of fungus disease on a plant comprising applying to the plant locus an effective amount of a compound selected from those represented by the Formula III and agro-
5 nomically acceptable salts thereof:

Formula III

wherein each E is independently chloro, bromo, iodo, trifluoromethyl or trifluoromethoxy.

32. A method of controlling the growth of
10 fungus disease on a plant comprising applying to the plant locus an effective amount of a compound selected from those represented by the Formula IV and agro-
nominally acceptable salts thereof:

Formula IV

-50-

wherein each W is independently chloro, bromo, iodo, trifluoromethyl or trifluoromethoxy.

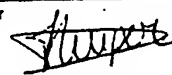

33. A method according to Claim 32 wherein W is chloro.

INTERNATIONAL SEARCH REPORT

PCT/US 90/04002

International Application No

I. CLASSIFICATION OF SUBJECT MATTER (if several classification symbols apply, indicate all) ⁴		
According to International Patent Classification (IPC) or to both National Classification and IPC		
IPC ⁵ : C 07 D 277/56, A 01 N 43/78		
II. FIELDS SEARCHED		
Minimum Documentation Searched ⁷		
Classification System	Classification Symbols	
IPC ⁵	C 07 D 277/00, A 01 N 43/00	
Documentation Searched other than Minimum Documentation to the Extent that such Documents are included in the Fields Searched ⁸
